AP® Computer Science A and AB

Content of Appendixes

Class Summary and Index

Class* --- Package	Description	Page	Tested in AP CS Exam?
AbstractGrid --- info.gridworld.grid	AbstractGrid contains the methods that are common to grid implementations.	D - 1, D - 2	Implementation (AB only)
Actor --- info.gridworld.actor	An Actor is an entity that can act. It has a color and direction.	B - 3	API only
ActorWorld --- info.gridworld.actor	An ActorWorld is occupied by actors.	Student Manual Part 3	Not tested
BoundedGrid --- info.gridworld.grid	A BoundedGrid is a rectangular grid with a finite number of rows and columns.	D - 3, D – 4	Implementation (AB only)
BoxBug --- (none)	A BoxBug traces out a square "box" of a given size.	C - 3	Implementation
BoxBugRunner --- (none)	This class runs a world that contains box bugs.	Student Manual Part 2	Not tested
Bug --- info.gridworld.actor	A Bug is an actor that can move and turn. It drops flowers as it moves.	C - 1, C - 2	Implementation
BugRunner --- (none)	This class runs a world that contains a bug and a rock, added at random locations.	In the projects/firstProject folder of the code distribution	Not tested
ChameleonCritter --- (none)	A ChameleonCritter takes on the color of neighboring actors as it moves through the grid.	C - 6	Implementation
ChameleonRunner --- (none)	This class runs a world that contains chameleon critters.	In the projects/critters folder of the code distribution	Not tested

***Bold formatting** of a class name indicates that students are responsible for the use of that class on the AP Computer Science Exams at the level indicated in this chart.

Class* **Package**	**Description**	**Page**	**Tested in AP CS Exam?**
`CrabCritter` (none)	A `CrabCritter` looks at a limited set of neighbors when it eats and moves.	Student Manual Part 4	Not tested
`CrabRunner` (none)	This class runs a world that contains crab critters.	In the `projects/critters` folder of the code distribution	Not tested
`Critter` `info.gridworld.actor`	A `Critter` is an actor that moves through its world, processing other actors in some way and then picking a new location.	C - 4, C - 5, C - 6	Implementation
`CritterRunner` (none)	This class runs a world that contains critters.	In the `projects/critters` folder of the code distribution	Not tested
`Flower` `info.gridworld.actor`	A `Flower` is an actor that darkens over time. Some actors drop flowers as they move.	B - 4	API only
`Grid` `info.gridworld.grid`	`Grid` provides an interface for a two-dimensional, grid-like environment containing arbitrary objects.	B - 2	API only
`Location` `info.gridworld.grid`	A `Location` object represents the row and column of a location in a two-dimensional grid.	B - 1	API only
`Rock` `info.gridworld.actor`	A `Rock` is an actor that does nothing. It is commonly used to block other actors from moving.	B - 4	API only
`UnboundedGrid` `info.gridworld.grid`	An `UnboundedGrid` is a rectangular grid with an unbounded number of rows and columns.	D - 5, D - 6	Implementation (AB only)
`World` `info.gridworld.world`	A `World` is the mediator between a grid and the GridWorld GUI.	In the API documentation of the code distribution	Not tested

***Bold formatting** of a class name indicates that students are responsible for the use of that class on the AP Computer Science Exams at the level indicated in this chart.

Appendix B — Testable API

`info.gridworld.grid.Location` class (`implements Comparable`)

`public Location(int r, int c)`
constructs a location with given row and column coordinates

`public int getRow()`
returns the row of this location

`public int getCol()`
returns the column of this location

`public Location getAdjacentLocation(int direction)`
returns the adjacent location in the direction that is closest to `direction`

`public int getDirectionToward(Location target)`
returns the closest compass direction from this location toward `target`

`public boolean equals(Object other)`
returns `true` if `other` is a `Location` with the same row and column as this location; `false` otherwise

`public int hashCode()`
returns a hash code for this location

`public int compareTo(Object other)`
returns a negative integer if this location is less than `other`, zero if the two locations are equal, or a positive integer if this location is greater than `other`. Locations are ordered in row-major order.
Precondition: `other` is a `Location` object.

`public String toString()`
returns a string with the row and column of this location, in the format (row, col)

Compass directions:

```
public static final int NORTH = 0;
public static final int EAST = 90;
public static final int SOUTH = 180;
public static final int WEST = 270;
public static final int NORTHEAST = 45;
public static final int SOUTHEAST = 135;
public static final int SOUTHWEST = 225;
public static final int NORTHWEST = 315;
```

Turn angles:

```
public static final int LEFT = -90;
public static final int RIGHT = 90;
public static final int HALF_LEFT = -45;
public static final int HALF_RIGHT = 45;
public static final int FULL_CIRCLE = 360;
public static final int HALF_CIRCLE = 180;
public static final int AHEAD = 0;
```

`info.gridworld.grid.Grid<E>` interface

`int getNumRows()`
returns the number of rows, or -1 if this grid is unbounded

`int getNumCols()`
returns the number of columns, or -1 if this grid is unbounded

`boolean isValid(Location loc)`
returns `true` if `loc` is valid in this grid, `false` otherwise
Precondition: `loc` is not `null`

`E put(Location loc, E obj)`
puts `obj` at location `loc` in this grid and returns the object previously at that location (or `null` if the location was previously unoccupied).
Precondition: (1) `loc` is valid in this grid (2) `obj` is not `null`

`E remove(Location loc)`
removes the object at location `loc` from this grid and returns the object that was removed (or `null` if the location is unoccupied)
Precondition: `loc` is valid in this grid

`E get(Location loc)`
returns the object at location `loc` (or `null` if the location is unoccupied)
Precondition: `loc` is valid in this grid

`ArrayList<Location> getOccupiedLocations()`
returns an array list of all occupied locations in this grid

`ArrayList<Location> getValidAdjacentLocations(Location loc)`
returns an array list of the valid locations adjacent to `loc` in this grid
Precondition: `loc` is valid in this grid

`ArrayList<Location> getEmptyAdjacentLocations(Location loc)`
returns an array list of the valid empty locations adjacent to `loc` in this grid
Precondition: `loc` is valid in this grid

`ArrayList<Location> getOccupiedAdjacentLocations(Location loc)`
returns an array list of the valid occupied locations adjacent to `loc` in this grid
Precondition: `loc` is valid in this grid

`ArrayList<E> getNeighbors(Location loc)`
returns an array list of the objects in the occupied locations adjacent to `loc` in this grid
Precondition: `loc` is valid in this grid

`info.gridworld.actor.Actor` class

`public Actor()`
constructs a blue actor that is facing north

`public Color getColor()`
returns the color of this actor

`public void setColor(Color newColor)`
sets the color of this actor to `newColor`

`public int getDirection()`
returns the direction of this actor, an angle between 0 and 359 degrees

`public void setDirection(int newDirection)`
sets the direction of this actor to the angle between 0 and 359 degrees that is equivalent to `newDirection`

`public Grid<Actor> getGrid()`
returns the grid of this actor, or `null` if this actor is not contained in a grid

`public Location getLocation()`
returns the location of this actor, or `null` if this actor is not contained in a grid

`public void putSelfInGrid(Grid<Actor> gr, Location loc)`
puts this actor into location `loc` of grid `gr`. If there is another actor at `loc`, it is removed.
Precondition: (1) This actor is not contained in a grid (2) `loc` is valid in `gr`

`public void removeSelfFromGrid()`
removes this actor from its grid.
Precondition: this actor is contained in a grid

`public void moveTo(Location newLocation)`
moves this actor to `newLocation`. If there is another actor at `newLocation`, it is removed.
Precondition: (1) This actor is contained in a grid (2) `newLocation` is valid in the grid of this actor

`public void act()`
reverses the direction of this actor. Override this method in subclasses of `Actor` to define types of actors with different behavior

`public String toString()`
returns a string with the location, direction, and color of this actor

`info.gridworld.actor.Rock` class (`extends Actor`)

`public Rock()`
constructs a black rock

`public Rock(Color rockColor)`
constructs a rock with color `rockColor`

`public void act()`
overrides the `act` method in the `Actor` class to do nothing

`info.gridworld.actor.Flower` class (`extends Actor`)

`public Flower()`
constructs a pink flower

`public Flower(Color initialColor)`
constructs a flower with color `initialColor`

`public void act()`
causes the color of this flower to darken

Appendix C — Testable Code for APCS A/AB

Bug.java

```
package info.gridworld.actor;

import info.gridworld.grid.Grid;
import info.gridworld.grid.Location;

import java.awt.Color;

/**
 * A Bug is an actor that can move and turn. It drops flowers as it moves.
 * The implementation of this class is testable on the AP CS A and AB Exams.
 */

Quick Reference A/AB

Location Class (implements Comparable)

```
public Location(int r, int c)
public int getRow()
public int getCol()
public Location getAdjacentLocation(int direction)
public int getDirectionToward(Location target)
public boolean equals(Object other)
public int hashCode()
public int compareTo(Object other)
public String toString()

NORTH, EAST, SOUTH, WEST, NORTHEAST, SOUTHEAST, NORTHWEST, SOUTHWEST
LEFT, RIGHT, HALF_LEFT, HALF_RIGHT, FULL_CIRCLE, HALF_CIRCLE, AHEAD
```

Grid<E> Interface

```
int getNumRows()
int getNumCols()
boolean isValid(Location loc)
E put(Location loc, E obj)
E remove(Location loc)
E get(Location loc)
ArrayList<Location> getOccupiedLocations()
ArrayList<Location> getValidAdjacentLocations(Location loc)
ArrayList<Location> getEmptyAdjacentLocations(Location loc)
ArrayList<Location> getOccupiedAdjacentLocations(Location loc)
ArrayList<E> getNeighbors(Location loc)
```

Actor Class

```
public Actor()
public Color getColor()
public void setColor(Color newColor)
public int getDirection()
public void setDirection(int newDirection)
public Grid<Actor> getGrid()
public Location getLocation()
public void putSelfInGrid(Grid<Actor> gr, Location loc)
public void removeSelfFromGrid()
public void moveTo(Location newLocation)
public void act()
public String toString()
```

Rock Class (extends Actor)

```
public Rock()
public Rock(Color rockColor)
public void act()
```

Flower Class (extends Actor)

```
public Flower()
public Flower(Color initialColor)
public void act()
```

Bug Class (extends Actor)

```
public Bug()
public Bug(Color bugColor)
public void act()
public void turn()
public void move()
public boolean canMove()
```

BoxBug Class (extends Bug)

```
public BoxBug(int n)
public void act()
```

Critter Class (extends Actor)

```
public void act()
public ArrayList<Actor> getActors()
public void processActors(ArrayList<Actor> actors)
public ArrayList<Location> getMoveLocations()
public Location selectMoveLocation(ArrayList<Location> locs)
public void makeMove(Location loc)
```

ChameleonCritter Class (extends Critter)

```
public void processActors(ArrayList<Actor> actors)
public void makeMove(Location loc)
```

Quick Reference AB Only

AbstractGrid Class (implements Grid)

```
public ArrayList<E> getNeighbors(Location loc)
public ArrayList<Location> getValidAdjacentLocations(Location loc)
public ArrayList<Location> getEmptyAdjacentLocations(Location loc)
public ArrayList<Location> getOccupiedAdjacentLocations(Location loc)
public String toString()
```
